

Steps to configure project to run locally:

Node.js—this is required to run the project, if you don't have this/need help with getting it installed let me know and I'll walk through it

Live Server Extension:

1. In Vs code, download the Live Server extension
2. Configure the port in settings.json to use whichever your system is defaulting to, you'll see this port in later steps after running a command to listen for the server.

XAMP: XAMPP Control Panel v3.3.0 [Compiled: Apr 6th 2021]

1. I use XAMP for my server host and MySQL connections since they're both integrated within the same console.
2. Once XAMP is installed, start the Apache and MySQL services in the console

VS Code:

1. Got to https://github.com/KammyBee/CSCI441_VB_TeamA_Project and clone the repo locally if you haven't already
2. Open the repo in VS code
3. Open the terminal and navigate to webservice_server

```
kamdo@DESKTOP-6G4BVF5 MINGW64 ~/OneDrive/Documents/My Group Project/CSCI441_VB_TeamA_Project (main)
$ cd webservice_server
```

4. Run this command in the directory: `node index.js`
5. You'll see the port it's listening for below

```
kamdo@DESKTOP-6G4BVF5 MINGW64 ~/OneDrive/Documents/My Group Project/CSCI441_VB_TeamA_Project (main)
$ node index.js
Server listening at port: 3100
```

6. Make sure the port you're listening to matches the one the server is hosting
